Online Food Ordering Platform

Objectives

- The aim of this project is to develop a platform that allows users to order food and customize their meals according to their preferences.
- Customers will be able to filter through various types of cuisines, meal deals, and extras, selecting options that best fit their taste, while food vendors can list their offerings and keep track of what orders have been placed.
- Due to the requests from numerous food service providers, we have decided to create a web application that stores all necessary specifications for placing and tracking food orders.
- Once customers place their orders, they will be able to check the status at any time, and should they wish to cancel, a refund will be processed provided it is done before the vendor's specified cut-off time.

Description

Management Application (Intranet) The application will enable administrators to ensure its smooth operation and also validate food vendors' accounts. Its features include:

- Management of users: customers and vendors.
- Verification of new listings and updates to existing ones.
- Ordering and Management (Public Web) We will develop a web application that allows customers to sign up and log in using a username and password. Upon accessing the site, they can perform the following actions:
- Select the type of cuisine, deals, and add-ons they wish to order.
- Use discount codes.

- Manage personal information.
- Handle orders from the perspective of food vendors, who will be able to:
- Request a profile from the administrator.
- Ask the administrator to list new offerings or modify existing ones.
- Access an interface that allows them to manage their offerings through requests.
- View information on the orders placed.
- Make special offers. Additionally, the application will automatically perform functions such as verifying a purchase or canceling orders through email.

Target Audience

- The platform is intended for use by food vendors looking to have their offerings listed on our website and manage the sales of their food.
- These vendors will be pre-validated by administrators to ensure authenticity.
- They will make requests to list and modify their offerings, which will also need to be validated by administrators.
- Consumers represent another user group. They will visit our website to find meals that cater to their tastes, preferences, or location.
- They can purchase food from one or several vendors and have the option to cancel their orders within a set timeframe.
